Star Bulk Long Thesis

In a commodity business without pricing power, can stewardship create a measurable investment advantage?

Investment thesis dated 23 October 2026 | 5 November 2026

THE RESULT The saved comparison reports SBLK at 0.88x base asset NAV versus GNK at 0.94x. Curve-shaped implied freight is much closer: 93% versus 94% of the selected Cal-27 vector. The argument includes entry conditions, a pre-mortem and explicitly judgmental scenario weights.

APPROACH

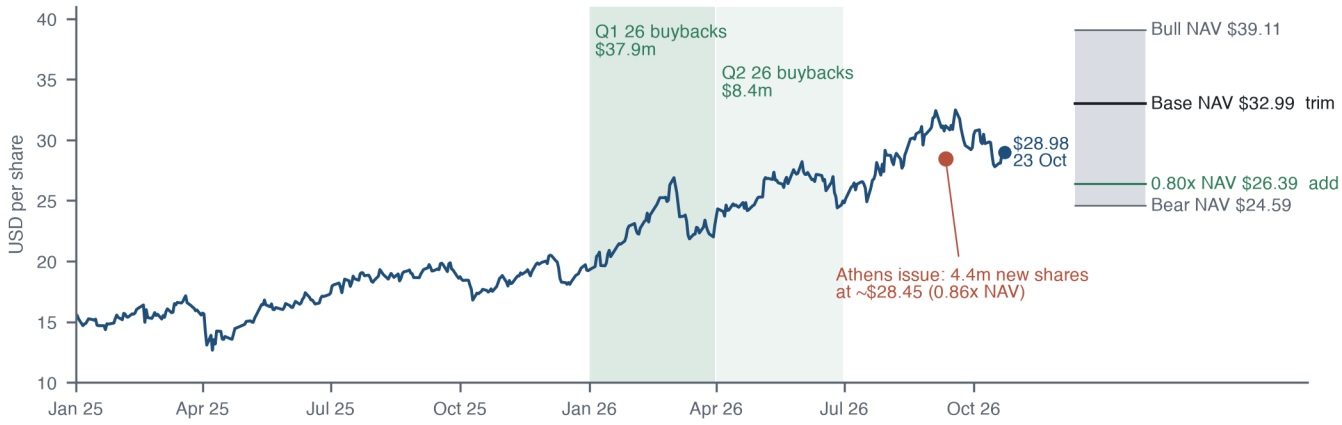

A two-page SBLK thesis connects ship-day costs, leverage, capital allocation, asset NAV and implied freight. A fleet-mix comparison against Genco separates operating quality from a disguised Capesize exposure. It reuses the independent shipping valuation engine.

SCOPE & LIMITATIONS

The share-price snapshot is 23 October; company inputs are earlier. Some appraisals and peer facts are secondary sources. A forward curve held flat over a ship's life is a stress assumption. The thesis has no realized investment track record.
